Internal Report

Rates of Adult Crime

February 2005

Joshua Mersky

CLS Adult Crime Overview: The Chicago Longitudinal Study (CLS) has collected data on adult arrest and incarceration histories using archived Cook County court data, manually searched Internet administrative data, and self reports. In addition to Cook County records, county-level data were obtained for Hennepin County Minnesota, which encompasses Minneapolis-St. Paul, as well as for all counties in Wisconsin and Iowa. Due to mobility in the sample, state-level incarceration data were compiled for out-of-state participants using Internet records for their state of residence (CLS participants were incarcerated in 21 different states). Federal records of incarceration were also obtained via the Internet. Primary measures of arrest and incarceration for this Internal Report exclude self-reported data that could not be verified through administrative records. The sample for adult incarceration (N=1413) includes all participants who completed the adult survey (2002-2004), whose records of arrest/incarceration were obtained from archived/administrative sources, or who were verified as residents of Illinois after age 18 using employment, public aid, and educational attainment records. The adult arrest sample (N=1418) is identical except for five additional individuals who had arrest records but were excluded from the adult incarceration sample because they were in the military or deceased before age 21.

**Indicators:** Unadjusted descriptive statistics (see Table 1) indicate that the overall rate of adult incarceration for the CLS sample is nearly 16%. As expected, males accounted for the vast majority of incarcerated participants (31% male vs. 1% female). Approximately 40% of the sample was arrested as an adult, although less than 23% had a guilty charge. Significant gender differences are also evident for the global arrest measure (62% males vs. 18% females) and any guilty arrest (. CPC preschool participation was associated with a significant reduction (unadjusted) in many adult crime measures, including any arrest (37.3% vs. 43.8%), any guilty arrest (20% vs. 27%), mean number of arrests (1.17 vs. 1.47) and guilty arrests (0.44 vs. 0.66), and incarceration (13.5% vs. 20.4%). Preschool attendance was also associated with a reduction in specific types of arrests (violent; property), guilty arrests (violent; drug; property) and offenses precipitating incarceration (violent; drug). The school-age component of the CPC program was not related to any differences in arrest or incarceration measures.

**Correlates:** Table 2 lists correlations between select explanatory variables and adult crime outcomes. Of note, a cumulative risk index (age 0-3) was significantly correlated with all adult arrest and incarceration variables included. Among the individual risk indicators measured prior to program participation, having a mother who did not graduate from high school and family AFDC receipt were the strongest correlates.

**Subgroup Comparisons:** Tables 3a and 3b show the mean rates of incarceration and arrest as they vary by certain background characteristics measured prior to CPC program participation. Significant unadjusted differences were evident for several individual-level variables. For example, youths who scored below average on a composite measure of social functioning from grades 1 through 6 (SEMAT16D) had a rate of incarceration three times greater and a rate of arrest two times greater than individuals rated above average. In addition, a number of family-level indicators were associated with either increased rates of incarceration or arrest. Receiving public aid and having a mother who did not complete high school was associated with both arrest and incarceration.

Comparisons to Selected Samples: Figures 1 and 2 compare the incarceration rates for CLS participants with overall national averages. Figure 1 shows that the rate of incarceration for the CLS sample overall is nearly double that of the national rate for African Americans under age 25. Figure 2 reveals that the rate of incarceration for males in the CLS is also roughly double national norms. Although not depicted, Table 3 shows that African Americans were more likely to be arrested than Hispanics in the CLS sample, but incarceration rates were comparable.

*Note.* All coefficients are from probit regression analysis transformed to marginal effects. All models are adjusted for sex of child, race/ethnicity, earlier/later program participation and child protection case histories prior to CPC preschool participation (Age 0-3). IFR indicates adjustments for the 8 individual indicators of family risk. IFR + S indicates adjustments for the 8 indicators of family risk and program sites. FR indicates adjustments for the family risk index only. FR + S indicates adjustments for the family risk index and program sites. Extended models are also adjusted for kindergarten achievement.

Table 4 (continued)

### Adjusted Means and Differences for CPC Extended Groups for Adult Arrest and Incarceration
